

CA Hangman

Due : October 18th 2025

Using only the C# functionality covered during the first four weeks of the module, you are required to create a **console-based Hangman game**.

The game should use **film titles** as the words that the player has to guess. You should demonstrate your understanding of the C# programming concepts covered in class, including variables, selection statements, loops, arrays and/or collections.

The program must contain a collection of film titles that can be used as the words for the Hangman game, use either:

- An **array**, or
- A **collection** such as a `List`.

A list of film title is available on blackboard but studentsa may use their own.

The hangman program should:

- Display the film title as a series of hidden letters.
- Allow the player to guess individual letters.
- Indicate whether a guessed letter is correct or incorrect.
- Keep track of the letters that have already been guessed.
- Update the displayed film title when the player correctly guesses a letter.
- Keep track of the number of incorrect guesses.
- Display a Hangman figure or other visual representation of the player's progress.

The design of the Hangman figure is left to the user discretion.

The player information should include:

- Player name , Film title , Game result – won or lost

Use either an **array or collection structure** to store this information.

When a game has finished, display a menu allowing the player to choose what they want to do next.

The menu should provide at least the following options:

1. **Play again**
2. **View statistics**
3. **Quit**

Player statistics should include:

- Player name
- Film title
- Whether the game was **won or lost**
- Total number of games played
- Total number of games won
- Total number of games lost

Marking scheme

Game functionality	40%
GUI	30%
Game statistics	10%
Error handling	10%
Design	10%
